# **API REFERENCE**

This page contains auto-generated API reference documentation<sup>1</sup>.

# 1.1 pine

# 1.1.1 Subpackages

pine.backend

### **Subpackages**

pine.backend.admin

This module implements all methods required for user authentication when using PINE's db authentication rather than an external Auth service

### **Submodules**

pine.backend.admin.bp

### **Module Contents**

### **Functions**

get_users()	Get the list of all users' details (id, email, and password
	hash)
get_user(user_id)	Given a user_id, return the user's details (id, email, and
	password hash)
update_user_password(user_id)	Change the password hash stored in the database for the
	given user to a newly calculated password hash derived
	from
update_user(user_id)	Change the details stored in the database for the given user
	to those provided in the json body of this request.
	continues on next page

Table	1 -	<ul> <li>continued</li> </ul>	from	previous page	
IUDIC		COLLINIACA	110111	provious page	

	o . oommada p. o pago
add_user()	Add a new user to PINE, with the details provided in the
	json body of this request (id, email, and password hash).
delete_user(user_id)	Delete the user matching the given user_id
system_export()	Export the contents of the database as a zip file
system_import()	Import the contents of the data provided in the request body
	to the database
<pre>init_app(app)</pre>	

pine.backend.admin.bp.bp

pine.backend.admin.bp.get\_users()

Get the list of all users' details (id, email, and password hash) :return: str

pine.backend.admin.bp.get\_user(user\_id)

Given a user\_id, return the user's details (id, email, and password hash) :param user\_id: str :return: str

pine.backend.admin.bp.update\_user\_password(user\_id)

Change the password hash stored in the database for the given user to a newly calculated password hash derived from the password provided in the json body of this request. :param user\_id: :return: Response

pine.backend.admin.bp.update\_user(user\_id)

Change the details stored in the database for the given user to those provided in the json body of this request. :param user\_id: str :return: Response

pine.backend.admin.bp.add\_user()

Add a new user to PINE, with the details provided in the json body of this request (id, email, and password hash). This method will calculate and store a password hash based upon the provided password :return: Response

pine.backend.admin.bp.delete\_user(user\_id)

Delete the user matching the given user\_id :param user\_id: str :return: Response

pine.backend.admin.bp.system\_export()

Export the contents of the database as a zip file :return: Response

pine.backend.admin.bp.system\_import()

Import the contents of the data provided in the request body to the database :return: Response

pine.backend.admin.bp.init\_app(app)

### pine.backend.annotations

This module contains the api methods required to perform and display annotations in the front-end and store the annotations in the backend

### **Submodules**

pine.backend.annotations.bp

### **Module Contents**

### **Functions**

check_document_by_id(doc_id: str)	Verify that a document with the given doc_id exists and that
oneon_accamenc_by_ra(acc_ia.sa)	the logged in user has permissions to access the
- 1 1 1 + (1 1 - + )	the logged in user has permissions to access the

pine.backend.annotations.bp.bp

pine.backend.annotations.bp.check\_document\_by\_id(doc\_id: str)

Verify that a document with the given doc\_id exists and that the logged in user has permissions to access the document :param doc\_id: str :return: dict

pine.backend.annotations.bp.check\_document (doc: dict)

pine.backend.annotations.bp.get\_my\_annotations\_for\_document(doc\_id)

Get the list of annotations (key, start\_index, end\_index) produced by the logged in user for the document matching the provided doc\_id. :param doc\_id: str :return: Response

pine.backend.annotations.bp.get\_others\_annotations\_for\_document(doc\_id)

Get the list of annotations (key, start\_index, end\_index) produced by all other users, not including the logged in user for the document matching the provided doc\_id. :param doc\_id: str :return: str

pine.backend.annotations.bp.get\_annotations\_for\_document(doc\_id)

Get the list of annotations (key, start\_index, end\_index) produced by all users for the document matching the provided doc\_id. :param doc\_id: str :return: str

pine.backend.annotations.bp.get\_current\_annotation(doc\_id, user\_id)

Get all annotations of the provided document created by the given user. :param doc\_id: str :param user\_id: str :return: List

pine.backend.annotations.bp.check\_overlapping\_annotations(collection,

*ner\_annotations*)

pine.backend.annotations.bp.set\_document\_to\_annotated\_by\_user(doc\_id, user\_id)

Modify the parameter in the database for the document signifying that the given user has annotated the given

document :param doc\_id: str :param user\_id: str :return: whether the update succeeded :rtype: bool

```
pine.backend.annotations.bp._make_annotations(body)

pine.backend.annotations.bp._add_or_update_annotation(new_annotation)

pine.backend.annotations.bp.save_annotations(doc_id)

Save new NER annotations and labels to the database as an entry for the logged in user, for the document. If there are already annotations, use a patch request to update with the new annotations. If there are not, use a post request to create a new entry: :param doc_id: str:return: bool

pine.backend.annotations.bp.save_collection_annotations(collection_id: str)

pine.backend.annotations.bp.init_app(app)

pine.backend.collections.bp.user_can_modify_document_metadata_by_id(collection_id)
pine.backend.collections.bp.get_user_collections(archived, page)
    Return collections for the logged in user using pagination. Returns all collections if parameter "page" is "all",
    or the collections associated with the given page. Can return archived or un-archived collections based upon the
    "archived" flag. :param archived: Bool :param page: str :return: Response
pine.backend.collections.bp.get_unarchived_user_collections(page)
    Return unarchived user collections for the corresponding page value. Default value returns collections for all
    pages. :param page: str :return: Response
```

```
pine.backend.collections.bp.get_archived_user_collections(page)
     Return archived user collections for the corresponding page value. Default value returns collections for all
     pages. :param page: str :return: Response
pine.backend.collections.bp.archive_or_unarchive_collection(collection_id,
                                                                                 archive)
     Set the "archived" boolean flag for the collection matching the provided collection_id. :param collection_id: str
     :param archive: Bool :return: Response
pine.backend.collections.bp.archive_collection(collection_id)
     Archive the collection matching the provided collection id :param collection_id: str :return: Response
pine.backend.collections.bp.unarchive_collection(collection_id)
     Unarchive the collection matching the provided collection id :param collection_id: str :return: Response
pine.backend.collections.bp.get_collection(collection_id)
     Return the collection object for the collection matching the provided collection id. This object has the fields:
     'creator_id', 'annotators', 'viewers', 'labels', 'metadata', 'archived', and 'configuration'. :param collection_id:
     str :return: Response
pine.backend.collections.bp.download_collection(collection_id)
pine.backend.collections.bp.get_doc_and_overlap_ids(collection_id)
     Return lists of ids for overlapping and non-overlapping documents for the collection matching the provided
     collection id. :param collection id: str :return: tuple
pine.backend.collections.bp.add_annotator_to_collection(collection_id)
pine.backend.collections.bp.add_viewer_to_collection(collection_id)
pine.backend.collections.bp.add_label_to_collection(collection_id)
pine.backend.collections.bp.get_overlap_ids(collection_id)
     Return the list of ids for overlapping documents for the collection matching the provided collection id. :param
     collection_id: str :return: tuple
pine.backend.collections.bp._upload_documents(collection, docs)
pine.backend.collections.bp.create_collection()
     Create a new collection based upon the entries provided in the POST request's associated form fields. These
     fields include: collection - collection name overlap - ratio of overlapping documents. (0-1) with 0 being no
     overlap and 1 being every document has overlap, ex:
          .90 - 90% of documents overlap
     train every - automatically train a new classifier after this many documents have been annotated pipelineId - the
     id value of the classifier pipeline associated with this collection (spacy, opennlp, corenlp) classifierParameters
     - optional parameters that adjust the configuration of the chosen classifier pipeline. archived - whether or not
     this collection should be archived. A collection can be created with documents listed in a csv file. Each new
     line in the csv represents a new document. The data of this csv can be passed to this method through the POST
     request's FILES field "file". used when creating a collection based on an uploaded csv file:
          csvTextCol - column of csv containing the text of the documents (default: 0) csvHasHeader - boolean
```

for whether or not the csv file has a header row (default: False)

A collection can also be created with a number of images through FILES fields "imageFileN" where N is an (ignored) index :return: information about the created collection

```
pine.backend.collections.bp._check_collection_and_get_image_dir(collection_id,
                                                                      path)
pine.backend.collections.bp.get_static_collection_images (collection_id)
pine.backend.collections.bp.get_collection_images (collection_id)
```

```
pine.backend.collections.bp.get_collection_image (collection_id, path)
pine.backend.collections.bp.get_collection_image_exists (collection_id, path)

```
class pine.backend.data.service.PerformanceHistory
     Bases: object
     Initialize self. See help(type(self)) for accurate signature.
     pformat (self, **kwargs)
     pprint (self)
     add (self, rest_type, path, response)
pine.backend.data.service.PERFORMANCE_HISTORY
pine.backend.data.service._standardize_path (path, *additional_paths)
pine.backend.data.service.url(path, *additional_paths)
     Returns a complete URL for the given eve-relative path(s).
          Parameters
                • path – str: eve-relative path (e.g. "collections" or ["collections", id])
                • additional_paths - str[]: any additional paths to append
          Returns str url
pine.backend.data.service.where_params(where)
     Returns a "where" parameters object that can be passed to eve.
     Eve requires that dict parameters be serialized as JSON.
          Parameters where – dict: dictionary of "where" params to pass to eve
          Returns dict "where" params
pine.backend.data.service.params(params)
     Returns a parameters object that can be passed to eve.
     Eve requires that dict parameters be serialized as JSON.
          Parameters where – dict: dictionary of "where" params to pass to eve
          Returns dict "where" params
pine.backend.data.service.get(path, **kwargs)
     Wraps requests.get for the given eve-relative path.
          Parameters
                • path – str: eve-relative path (e.g. "collections" or ["collections", id])
                • **kwargs – dict: any additional arguments to pass to requests.get
          Returns requests. Response
pine.backend.data.service.post (path, **kwargs)
     Wraps requests.post for the given eve-relative path.
          Parameters
                • path – str: eve-relative path (e.g. "collections" or ["collections", id])
                • **kwargs – dict: any additional arguments to pass to requests.post
          Returns requests. Response
pine.backend.data.service.put(path, **kwargs)
     Wraps requests.put for the given eve-relative path.
```

### **Parameters**

- path str: eve-relative path (e.g. "collections" or ["collections", id])
- \*\*kwargs dict: any additional arguments to pass to requests.put

### Returns requests. Response

```
pine.backend.data.service.delete(path, **kwargs)
```

Wraps requests.delete for the given eve-relative path.

### **Parameters**

- path str: eve-relative path (e.g. "collections" or ["collections", id])
- \*\*kwargs dict: any additional arguments to pass to requests.delete

### Returns requests. Response

```
pine.backend.data.service.patch (path, **kwargs)
Wraps requests.patch for the given eve-relative path.
```

### **Parameters**

- path str: eve-relative path (e.g. "collections" or ["collections", id])
- \*\*kwargs dict: any additional arguments to pass to requests.patch

### Returns requests. Response

```
pine.backend.data.service.get_items (path, params={})

    Stops all the workers.
_start_registration_listener(self)
    Starts the registration worker. :rtype: bool
_start_processing_listeners(self)
    Starts the processing workers. :rtype: bool
_start_channel_watchdog(self)
    Starts the channel watchdog workers in an asyncio-only thread. It monitors the channel TTL's. :rtype:
    bool
_stop_channel_watchdog(self)
    Stops the channel watchdog workers in an asyncio-only thread. :rtype: bool
```

```
_registration_listener(self)
```

Registration Listener Implementation.

### async \_channel\_watchdog(self)

Channel Watchdog Implementation. In asyncio, it monitors the channel-ttl keys and the channels SET to expire registered services as needed. The other functionality is to register new channels as they're added to the pubsub in the processing listener.

```
static _thread_killer(thread_id)
```

```
_processing_listener_handler_wrapper (self, job_id, job_type, job_queue, job_data)
```

```
_processing_listener(self)
```

Processing Listener Implementation. Runs a handler when a processing message gets send over an already registered channel.

```
pine.backend.job_manager.service.sm
```

pine.backend.pineiaa.bratiaa.evaluation

Functions for computing the difference between two sets of annotations.

### **Module Contents**

### **Functions**

<pre>exact_match_instance_evaluation(ann_list_1,</pre>	
ann_list2, tokens=None)	
<pre>exact_match_token_evaluation(ann_list_1,</pre>	Annotations are split into token-sized bits before true posi-
ann_list_2, tokens=None)	tives, false positives and false negatives are computed.
counter2list(c)	
_read_token_annotations(ann_list, tokens)	Yields a new annotation for each token overlapping with an
	annotation. If annotations are overlapping each other,

to-kens=None)

Annotations are split into token-sized bits before true positives, false positives and false negatives are computed.

Sub-token annotations are expanded to full tokens. Long annotations will influence the results more than short annotations. Boundary errors for adjacent annotations with the same label are ignored!

Yields a new annotation for each token overlapping with an annotation. If annotations are overlapping each other, there will be multiple annotations for a single token.

pine.backend.create_app(test_config=None)
pine.backend.VERSION
pine.backend.__version__

pine.client
PINE client module.

Submodules
pine.client.client
PINE client classes module.
```

### **Module Contents**

### **Classes**

BaseClient(base_uri: str, name: str = None)	Base class for a client using a REST interface.		
<pre>EveClient(eve_base_uri: str, mongo_base_uri: str =</pre>	A client to access Eve and, optionally, its underlying Mon-		
None, mongo_dbname: str = DEFAULT_DBNAME)	goDB instance.		
PineClient(backend_base_uri: str)	A client to access PINE (more specifically: the backend).		
LocalPineClient(backend_base_uri: str,	A client for a local PINE instance, including an		
eve_base_uri: str, mongo_base_uri: str = None,	:py:class<.EveClient>.		
mongo_dbname: str = EveClient.DEFAULT_DBNAME)			

### **Functions**

```
_standardize_path(path: str, *additional_paths: Standardize path(s) into a list of path components. typing.List[str])
```

pine.client.client.\_standardize\_path ( $path: str, *additional\_paths: typing.List[str]$ )  $\rightarrow$  typing.List[str]

Standardize path(s) into a list of path components.

### **Parameters**

- path (str) relative path, e.g. "users"
- \*additional\_paths (list(str), optional) any additional path components in a list

Returns the standardized path components in a list

**Return type** list(str)

```
class pine.client.client.BaseClient(base_uri: str, name: str = None)
    Bases: object
```

Base class for a client using a REST interface.

Constructor.

### **Parameters**

- base\_uri (str) the base URI for the server, e.g. "http://localhost:5000"
- name (str, optional) optional human-readable name for the server, defaults to None

```
__metaclass___
```

### base\_uri :str

The server's base URI.

Type str

### session :requests.Session

The currently open session, or None.

Type requests. Session

# abstract is\_valid(self) Returns whether this client

Returns whether this client and its connection(s) are valid.

**Returns** whether this client and its connection(s) are valid

# Return type bool

```
uri (self, path: str, *additional_paths: typing.List[str])
Makes a complete URI from the given path(s).
```

#### **Parameters**

- path (str) relative path, e.g. "users"
- \*additional\_paths (list(str), optional) any additional path components

**Returns** the complete, standardized URI including the base URI, e.g. "http://localhost:5000/users"

## Return type str

```
_req (self, method: str, path: str, *additional_paths: typing.List[str], **kwargs)

Makes a requests call, checks for errors, and returns the response.
```

#### **Parameters**

- method (str) REST method ("get", "post", etc.)
- path (str) relative path, e.g. "users"
- \*additional\_paths (list(str), optional) any additional path components
- \*\*kwargs (dict) any additional kwargs to send to requests

Raises exceptions.PineClientHttpException – if the HTTP request returns an error

Returns the requests requests. Response object

Return type requests. Response

```
get (self, path: str, *additional_paths: typing.List[str], **kwargs)
Makes a requests GET call, checks for errors, and returns the response.
```

# **Parameters**

- path (str) relative path, e.g. "users"
- \*additional\_paths (list(str), optional) any additional path components
- \*\*kwargs (dict) any additional kwargs to send to requests

 $\textbf{Raises} \ \textbf{exceptions.PineClientHttpException} - if the \ HTTP \ request \ returns \ an \ error$ 

Returns the requests Response object

## **Return type** requests. Response

```
put (self, path: str, *additional_paths: typing.List[str], **kwargs)
    Makes a requests PUT call, checks for errors, and returns the response.
```

#### **Parameters**

• path (str) - relative path, e.g. "users"

- \*additional\_paths (list(str), optional) any additional path components
- \*\*kwargs (dict) any additional kwargs to send to requests

Raises exceptions.PineClientHttpException — if the HTTP request returns an error

Returns the requests Response object

Return type requests. Response

patch (self, path: str, \*additional\_paths: typing.List[str], \*\*kwargs)

Makes a requests PATCH call, checks for errors, and returns the response.

#### **Parameters**

- path (str) relative path, e.g. "users"
- \*additional\_paths (list(str), optional) any additional path components
- \*\*kwargs (dict) any additional kwargs to send to requests

Raises exceptions.PineClientHttpException – if the HTTP request returns an error

Returns the requests Response object

Return type requests. Response

post (self, path: str, \*additional paths: typing.List[str], \*\*kwargs)

Makes a requests POST call, checks for errors, and returns the response.

## **Parameters**

- path (str) relative path, e.g. "users"
- \*additional\_paths (list(str), optional) any additional path components
- \*\*kwargs (dict) any additional kwargs to send to requests

Raises exceptions.PineClientHttpException – if the HTTP request returns an error

Returns the requests Response object

Return type requests. Response

A client to access Eve and, optionally, its underlying MongoDB instance.

Constructor.

## **Parameters**

- eve\_base\_uri (str) the base URI for the eve server, e.g. "http://localhost:5001"
- mongo\_base\_uri (str, optional) the base URI for the mongodb server, e.g. "mongodb://localhost:27018", defaults to None
- mongo\_dbname (str, optional) the DB name that PINE uses, defaults to "pmap\_nlp"

```
DEFAULT_DBNAME :str = pmap_nlp
    The default DB name used by PINE.
        Type str
mongo_base_uri :str
    The base URI for the MongoDB server.
        Type str
mongo:pymongo.MongoClient
    The pymongo.mongo_client.MongoClient instance.
        Type pymongo.mongo_client.MongoClient
mongo_db :pymongo.database.Database
    The pymongo.database.Database instance.
        Type pymongo.database.Database
is_valid(self)
    Returns whether this client and its connection(s) are valid.
        Returns whether this client and its connection(s) are valid
        Return type bool
ping(self)
    Pings the eve server and returns the result.
        Raises exceptions.PineClientHttpException - if the HTTP request returns an er-
        Returns the JSON response from the server (probably "pong")
about (self)
    Returns the 'about' dict from the server.
        Raises exceptions. PineClientHttpException - if the HTTP request returns an er-
        Returns the JSON response from the server
        Return type dict
get_resource (self, resource: str, resource_id: str)
    Gets a resource from eve by its ID.
        Raises exceptions.PineClientHttpException - if the HTTP request returns an er-
            ror
        Returns the JSON object response from the server
        Return type dict
_add_or_replace_resource (self, resource: str, obj: dict, valid_fn: typing.Callable[[dict, typ-
                                 ing.Callable[[str], None]], bool] = None)
    Adds or replaces the given resource.
        Parameters
             • resource (str) - the resource type, e.g. "users"
             • obj (dict) – the resource object
             • valid_fn (function, optional) - a function to validate the resource object, de-
              faults to None
```

- exceptions.PineClientValueException if a valid\_fn is passed in and the object fails
- exceptions.PineClientHttpException if the HTTP request returns an error

**Returns** the ID of the added/replaced resource

Return type str

\_add\_resources (self, resource: str, objs: typing.List[dict], valid\_fn: typing.Callable[[dict, typ-ing.Callable[[str], None]], bool] = None, replace\_if\_exists: bool = False)

Tries to add all the resource objects at once, optionally falling back to individual replacement if that fails.

## **Parameters**

- resource (str) the resource type, e.g. "users"
- **objs** (list (dict)) the resource objects
- valid\_fn (function, optional) a function to validate the resource object, defaults to None
- replace\_if\_exists (bool, optional) whether to replace the resource with the given value if it already exists on the server, defaults to False

#### Raises

- exceptions.PineClientValueException if a valid\_fn is passed in and any of the objects fails
- exceptions.PineClientHttpException if the HTTP request returns an error

**Returns** the IDs of the added resources

Return type list(str)

add\_users (self, users: typing.List[dict], replace\_if\_exists=False)
 Adds the given users.

#### **Parameters**

- users (list (dict)) the user objects
- replace\_if\_exists (bool, optional) whether to replace the resource with the given value if it already exists on the server, defaults to False

## Raises

- exceptions.PineClientValueException if any of the user objects are not valid, see models.is\_valid\_eve\_user()
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns the IDs of the added users

**Return type** list(str)

get\_users (self)

Gets all users.

Raises exceptions.PineClientHttpException – if the HTTP request returns an error

Returns all the users

Return type list(dict)

```
add_pipelines (self, pipelines: typing.List[dict], replace_if_exists=False)
Adds the given pipelines.
```

#### **Parameters**

- pipelines (list (dict)) the pipeline objects
- **replace\_if\_exists** (bool, optional) whether to replace the resource with the given value if it already exists on the server, defaults to False

#### Raises

- exceptions.PineClientValueException if any of the pipeline objects are not valid, see models.is\_valid\_eve\_pipeline()
- exceptions.PineClientHttpException if the HTTP request returns an error

**Returns** the IDs of the added pipelines

**Return type** list(str)

```
class pine.client.client.PineClient(backend_base_uri: str)
    Bases: pine.client.client.BaseClient
```

A client to access PINE (more specifically: the backend).

Constructor.

```
Parameters backend_base_uri (str) - the base URI for the backend server, e.g. "http://localhost:5000"
```

```
is valid(self)
```

Returns whether this client and its connection(s) are valid.

Returns whether this client and its connection(s) are valid

Return type bool

ping(self)

Pings the backend server and returns the result.

Raises exceptions.PineClientHttpException – if the HTTP request returns an error

**Returns** the JSON response from the server (probably "pong")

about (self)

Returns the 'about' dict from the server.

Raises exceptions.PineClientHttpException – if the HTTP request returns an error

**Returns** the JSON response from the server

Return type dict

```
get_logged_in_user(self)
```

Returns the currently logged in user, or None if not logged in.

Raises exceptions.PineClientHttpException – if the HTTP request returns an error

Returns currently logged in user, or None if not logged in

Return type dict

```
get_my_user_id(self)
    Returns the ID of the logged in user, or None if not logged in.
        Raises exceptions.PineClientHttpException - if the HTTP request returns an er-
        Returns the ID of the logged in user, or None if not logged in
        Return type str
is_logged_in(self)
    Returns whether the user is currently logged in or not.
        Raises exceptions. PineClientHttpException - if the HTTP request returns an er-
            ror
        Returns whether the user is currently logged in or not
        Return type bool
_check_login(self)
    Checks whether user is logged in and raises an exceptions. PineClientAuthException if not.
        Raises
             • exceptions.PineClientAuthException - if not logged in
             • exceptions.PineClientHttpException - if the HTTP request returns an error
get auth module (self)
    Returns the PINE authentication module, e.g. "eve".
        Raises exceptions.PineClientHttpException - if the HTTP request returns an er-
        Returns the PINE authentication module, e.g. "eve"
        Return type str
login_eve (self, username: str, password: str)
    Logs in using eve credentials, and returns whether it was successful.
        Parameters
             • username (str) - username
             • password (str) - password
        Raises
             • exceptions.PineClientAuthException - if auth module is not eve or login
              was not successful
             • exceptions.PineClientHttpException - if the HTTP request returns an error
        Returns whether the login was successful
        Return type bool
logout (self)
    Logs out the current user.
         Raises exceptions.PineClientHttpException - if the HTTP request returns an er-
```

ror

Returns all pipelines accessible to logged in user.

get pipelines(self)

- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

**Returns** all pipelines accessible to logged in user

Return type list(dict)

## collection\_builder (self, \*\*kwargs: dict)

Makes and returns a new models. CollectionBuilder with the logged in user.

Parameters \*\*kwargs (dict) - any additional args to pass in to the constructor

Returns a new models. CollectionBuilder with the logged in user

Return type models.CollectionBuilder

## create\_collection (self, builder: models.CollectionBuilder)

Creates a collection using the current value of the given builder and returns its ID.

Parameters builder (models.CollectionBuilder) - collection builder

#### Raises

- exceptions.PineClientValueException if the given collection is not valid, see models.is\_valid\_collection()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

**Returns** the created collection's ID

Return type str

get\_collection\_documents (self, collection\_id: str, truncate: bool, truncate\_length: int = 30)
Returns the documents in the given collection.

#### **Parameters**

- collection\_id(str) the ID of the collection
- **truncate** (bool) whether to truncate the document text (a good idea unless you need it)
- truncate\_length (int, optional) how many characters of the text you want if truncated, defaults to 30

**Returns** the documents in the given collection

**Return type** list(dict)

Will use the logged in user ID for the creator\_id if none is given. Although all the parameters are optional, you must provide values either in the document or through the kwargs in order to make a valid document.

## **Parameters**

- **document** (*dict*, *optional*) optional document dict, will be overridden with any kwargs, defaults to {}
- **creator\_id** (*str*, *optional*) optional creator\_id for the document, defaults to None (not set)

- **collection\_id** (*str*, *optional*) optional collection\_id for the document, defaults to None (not set)
- overlap (int, optional) optional overlap for the document, defaults to None (not set)
- text (str, optional) optional text for the document, defaults to None (not set)
- metadata (dict, optional) optional metadata for the document, defaults to None (not set)

- exceptions.PineClientValueException if the given document parameters are not valid, see models.is\_valid\_eve\_document()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns the created document's ID

## Return type str

add\_documents (self, documents: typing.List[dict], creator\_id: str = None, collection\_id: str = None)
Adds multiple documents at once and returns their IDs.

Will use the logged in user ID for the creator\_id if none is given.

#### **Parameters**

- documents (list (dict)) the documents to add
- creator\_id (str, optional) optional creator\_id to set in the documents, defaults to None (not set)
- **collection\_id**(str, optional) optional collection\_id to set in the documents, defaults to None (not set)

#### Raises

- exceptions.PineClientValueException if any of the given documents are not valid, see models.is\_valid\_eve\_document()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns the created documents' IDs

**Return type** list(str)

## **Parameters**

- document\_id (str) the document ID to annotate
- doc\_annotations (list(str)) document annotations/labels
- ner\_annotations (list) NER annotations, where each annotation is either a list
  or a dict

## Raises

- exceptions.PineClientValueException if any of the given annotations are not valid, see models.is\_valid\_annotation()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

**Returns** the annotation ID

Return type str

Annotates documents in a collection.

## **Parameters**

- collection\_id (str) the ID of the collection containing the documents to annotate
- document\_annotations (dict) a dict containing "ner" list and "doc" list
- **skip\_document\_updates** (bool) whether to skip updating the document "has\_annotated" map, defaults to False. This should only be True if you properly set the "has\_annotated" map when you created the document.

#### Raises

- exceptions.PineClientValueException if any of the given annotations are not valid, see models.is\_valid\_doc\_annotations()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

**Returns** the annotation IDs

Return type list(str)

list\_collections (self, include\_archived: bool = False)

Returns a list of user's collections.

**Parameters include\_archived** (bool) – whether to include archived collections, defaults to False

## Raises

- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns user's collections

**Return type** list(dict)

Downloads collection data.

# **Parameters**

- $collection\_id(str)$  the ID of the collection for which to download data
- include\_collection\_metadata (bool) whether to include collection metadata, defaults to True

- include\_document\_metadata (bool) whether to include document metadata, defaults to True
- include\_document\_text (bool) whether to include document text, defaults to True
- include\_annotations (bool) whether to include annotations, defaults to True
- include\_annotation\_latest\_version\_only (bool) whether to include only the latest version of annotations (True) or all versions (False), defaults to True

- exceptions.PineClientValueException if given empty collection ID
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error, such as if the collection doesn't exist

Returns collection data

Return type dict

Bases: pine.client.client.PineClient

A client for a local PINE instance, including an :py:class<.EveClient>.

Constructor.

## **Parameters**

- backend\_base\_uri (str) the base URI for the backend server, e.g. "http://localhost:5000"
- eve\_base\_uri (str) the base URI for the eve server, e.g. "http://localhost:5001"
- mongo\_base\_uri (str, optional) the base URI for the mongodb server, e.g. "mongodb://localhost:27018", defaults to None
- mongo\_dbname (str, optional) the DB name that PINE uses, defaults to "pmap\_nlp"

#### eve : EveClient

The local *EveClient* instance.

Type EveClient

## is\_valid(self)

Returns whether this client and its connection(s) are valid.

**Returns** whether this client and its connection(s) are valid

Return type bool

## pine.client.exceptions

PINE client exceptions module.

## **Module Contents**

Bases: Exception

Base class for PINE client exceptions.

Constructor.

## **Parameters**

- message (str) the message
- cause (Exception, optional) optional cause, defaults to None

#### message

The message.

Type str

**exception** pine.client.exceptions.**PineClientHttpException**(*method: str, path: str, resp: requests.Response*)

Bases: pine.client.exceptions.PineClientException

A PINE client exception caused by an underlying HTTP exception.

Constructor.

## **Parameters**

- **method** (str) the REST method ("get", "post", etc.)
- path (str) the human-readable path that caused the exception
- resp (requests.Response) the Response with the error info

resp

The Response with the error info

Type requests.Response

**exception** pine.client.exceptions.**PineClientValueException** (obj: dict, obj\_type: str)
Bases: pine.client.exceptions.PineClientException

A PINE client exception caused by passing invalid data.

Constructor.

## **Parameters**

- **obj** (dict) the error data
- **obj\_type** (str) human-readable type of object

**exception** pine.client.exceptions.**PineClientAuthException** (*message: str*, *cause: Exception = None*)

 $Bases: \verb"pine.client.exceptions.PineClientException"$ 

Base class for PINE client exceptions.

Constructor.

## **Parameters**

- message (str) the message
- cause (Exception, optional) optional cause, defaults to None

pine.client.log

## **Module Contents**

#### **Functions**

setup\_logging()

Sets up logging, if configured to do so.

```
pine.client.log.CONFIG_FILE_ENV :str = PINE_LOGGING_CONFIG_FILE
```

The environment variable that optionally contains the file to use for logging configuration.

Type str

```
pine.client.log.setup_logging()
```

Sets up logging, if configured to do so.

The environment variable named by <code>CONFIG\_FILE\_ENV</code> is checked and, if present, is passed to <code>logging.config.dictConfig()</code>.

pine.client.models

## **Module Contents**

#### **Classes**

CollectionBuilder(collection: dict = None, creator\_id: str = None, viewers: typing.List[str] = None, annotators: typing.List[str] = None, labels: typing.List[str] = None, title: str = None, description: str = None, allow\_overlapping\_ner\_annotations: bool = None, pipelineId: str = None, overlap: float = None, train\_every: int = None, classifierParameters: dict = None, document\_csv\_file: str = None, document\_csv\_file\_has\_header: bool = None, document\_csv\_file\_text\_column: int = None, image\_files: typing.List[str] = None)

A class that can build the form and files fields that are necessary to create a collection.

# **Functions**

_check_field_required_bool(obj: dict, field: str)	Checks that the given field is in the object and is a bool.
_check_field_int(obj: dict, field: str)	Checks that if the given field is in the object, that it is an
	int.
_check_field_required_int(obj: dict, field: str)	Checks that the given field is in the object and is an int.
_check_field_float(obj: dict, field: str)	Checks that if the given field is in the object, that it is a
	float.
_check_field_required_float(obj: dict, field:	Checks that the given field is in the object and is a float.
str)	
_check_field_string(obj: dict, field: str)	Checks that if the given field is in the object, that it is a
	string.
_check_field_required_string(obj: dict, field:	Checks that the given field is in the object and is a string.
str)	
_check_field_string_list(obj: dict, field: str,	Checks that if the given field is in the object, that it is a
$min_length: int = 0)$	string list.
_check_field_required_string_list(obj:	Checks that the given field is in the object and is a string
dict, field: str, min_length: int = 0)	list.
_check_field_dict(obj: dict, field: str)	Checks that if the given field is in the object, that it is a dict.
_check_field_required_dict(obj: dict, field: str)	Checks that the given field is in the object and is a dict.
_check_field_bool(obj: dict, field: str)	Checks that if the given field is in the object, that it is a
	bool.
<pre>is_valid_eve_user(user: dict, error_callback: typ-</pre>	Checks whether the given user object is valid.
ing.Callable[[str], None] = None)	
<pre>is_valid_eve_pipeline(pipeline: dict, er-</pre>	Checks whether the given pipeline object is valid.
ror_callback: typing.Callable[[str], None] = None)	
is_valid_eve_collection(collection: dict, er-	Checks whether the given collection object is valid.
ror_callback: typing.Callable[[str], None] = None)	
is_valid_collection(form: dict, files: dict, er-	Checks whether the given form and files parameters are
ror_callback: typing.Callable[[str], None] = None)	valid for creating a collection.
is_valid_eve_document(document: dict, er-	Checks whether the given document object is valid.
ror_callback: typing.Callable[[str], None] = None)	
is_valid_doc_annotation(ann: typing.Any, er-	Checks whether the given annotation is a valid document
ror_callback: typing.Callable[[str], None] = None)	label/annotation.
is_valid_ner_annotation(ann: typing.Any, er-	Checks whether the given annotation is a valid document
ror_callback: typing.Callable[[str], None] = None)	NER annotation.
<pre>is_valid_annotation(body: dict, error_callback:</pre>	Checks whether the given body is valid to create an anno-
typing.Callable[[str], None] = None)	tation.
is_valid_doc_annotations(doc_annotations:	Checks whether the given document annotations are valid.
dict, error_callback: typing.Callable[[str], None] = None)	
remove_eve_fields(obj: dict, remove_timestamps:	Removes fields inserted by eve from the given object.
bool = True, remove_versions: bool = True)	
remove_nonupdatable_fields(obj: dict)	Removes all non-updatable fields from the given object.

```
pine.client.models.ID_FIELD :str = _id
    The field used to store database ID.
```

Type str

pine.client.models.ITEMS\_FIELD :str = \_items

The field used to access the items in a multi-item database response.

Type str

pine.client.models.\_check\_field\_required\_bool (obj: dict, field: str)  $\rightarrow$  bool Checks that the given field is in the object and is a bool.

#### **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

**Returns** whether the given field is in the object and is a bool

# Return type bool

pine.client.models.\_check\_field\_int (obj: dict, field: str)  $\rightarrow$  bool Checks that if the given field is in the object, that it is an int.

#### **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

**Returns** if the given field is in the object, that it is an int

## Return type bool

pine.client.models.\_check\_field\_required\_int (obj: dict, field: str)  $\rightarrow$  bool Checks that the given field is in the object and is an int.

## **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

Returns whether the given field is in the object and is an int

## Return type bool

pine.client.models.\_check\_field\_float (obj: dict, field: str)  $\rightarrow$  bool Checks that if the given field is in the object, that it is a float.

## **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

**Returns** if the given field is in the object, that it is a float

## Return type bool

pine.client.models.\_check\_field\_required\_float (obj: dict, field: str)  $\rightarrow$  bool Checks that the given field is in the object and is a float.

## **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

**Returns** whether the given field is in the object and is a float

## Return type bool

pine.client.models.\_check\_field\_string (obj: dict, field: str)  $\rightarrow$  bool Checks that if the given field is in the object, that it is a string.

#### **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

Returns if the given field is in the object, that it is a string

## Return type bool

pine.client.models.\_check\_field\_required\_string (obj: dict, field: str)  $\rightarrow$  bool Checks that the given field is in the object and is a string.

## **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

**Returns** whether the given field is in the object and is a string

# Return type bool

pine.client.models.\_check\_field\_string\_list (obj: dict, field: str, min\_length: int = 0)  $\rightarrow$  bool Checks that if the given field is in the object, that it is a string list.

## **Parameters**

- **obj** (dict) the object to check
- **field** (*str*) the field to check
- min\_length (int, optional) the minimum length of the list (if > 0), defaults to 0

Returns if the given field is in the object, that it is a string list

## Return type bool

```
pine.client.models._check_field_required_string_list (obj: dict, field: str, min_length: int = 0) \rightarrow bool Checks that the given field is in the object and is a string list.
```

## **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check
- $min_length (int, optional)$  the minimum length of the list (if > 0), defaults to 0

**Returns** if the given field is in the object, that it is a string list

## Return type bool

```
pine.client.models._check_field_dict (obj: dict, field: str) \rightarrow bool Checks that if the given field is in the object, that it is a dict.
```

#### **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

**Returns** if the given field is in the object, that it is a dict

## Return type bool

```
pine.client.models._check_field_required_dict (obj: dict, field: str) \rightarrow bool Checks that the given field is in the object and is a dict.
```

## **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

Returns whether the given field is in the object and is a dict

Return type bool

```
pine.client.models._check_field_bool (obj: dict, field: str) \rightarrow bool Checks that if the given field is in the object, that it is a bool.
```

## **Parameters**

- **obj** (dict) the object to check
- **field** (str) the field to check

**Returns** if the given field is in the object, that it is a bool

## Return type bool

```
pine.client.models.is_valid_eve_user (user: dict, error_callback: typing.Callable[[str], None] = None) \rightarrow bool Checks whether the given user object is valid.
```

A valid user object has an \_id, firstname, and lastname that are non-empty string fields. If email, description, or passwdhash are present, they are string fields. If role is present, it is a list of strings that are either administrator or user.

#### **Parameters**

- user (dict) user object
- error\_callback (function, optional) optional callback that is called with any error messages, defaults to None

**Returns** whether the given user object is valid

Return type bool

```
pine.client.models.is_valid_eve_pipeline (pipeline: dict, error_callback: typ-ing.Callable[[str], None] = None) \rightarrow bool Checks whether the given pipeline object is valid.
```

A valid pipeline has an \_id, title, and name that are non-empty string fields. If description is provided, it is a string field. If parameters are provided, it is a dict field.

## **Parameters**

- **pipeline** (dict) pipeline object
- error\_callback (function, optional) optional callback that is called with any error messages, defaults to None

**Returns** whether the given pipeline object is valid

Return type bool

```
pine.client.models.is_valid_eve_collection(collection: dict, error\_callback: typing.Callable[[str], None] = None) <math>\rightarrow bool
```

Checks whether the given collection object is valid.

A valid collection has a creator\_id that is a non-empty string field. It has a labels that is a non-empty list of strings. If annotators or viewers are provided, they are lists of strings. If metadata or configuration are provided, they are dicts. If archived is provided, it is a bool.

#### **Parameters**

- collection (dict) collection object
- error\_callback (function, optional) optional callback that is called with any error messages, defaults to None

**Returns** whether the given collection object is valid

## Return type bool

```
pine.client.models.is_valid_collection (form: dict, files: dict, error_callback: typing.Callable[[str], None] = None) \rightarrow bool Checks whether the given form and files parameters are valid for creating a collection.
```

A valid form has a collection that is a dict field and is valid via <code>is\_valid\_eve\_collection()</code>. Additionally, the collection has string title and description fields in its metadata. It also has at least one element for labels, viewers, and annotators, and the <code>creator\_id</code> must be in both viewers and annotators.

The form also has overlap as a float field between 0 and 1 (inclusive), train\_every as an int field that is at least 5, and pipelineId as a string field.

If files are provided, file file and any files starting with imageFile are checked. If a file file is provided, the form must also have a boolean csvHasHeader field and an int csvTextCol field.

#### **Parameters**

- **form** (dict) form data to send to backend
- **files** (dict) file data to send to backend
- error\_callback (function, optional) optional callback that is called with any error messages, defaults to None

**Returns** whether the given form and files parameters are valid for creating a collection

## Return type bool

```
pine.client.models.is_valid_eve_document (document: dict, error_callback: typ-ing.Callable[[str], None] = None) \rightarrow bool Checks whether the given document object is valid.
```

A valid document has a creator\_id and collection\_id that are non-empty string fields. Optionally, it may have an int overlap field, string text``field, and dict ``metadata and has\_annotated fields.

#### **Parameters**

- document (dict) document object
- error\_callback (function, optional) optional callback that is called with any error messages, defaults to None

Returns whether the given document object is valid

#### Return type bool

```
pine.client.models.is_valid_doc_annotation (ann: typing.Any, error_callback: typing.Callable[[str], None] = None) \rightarrow bool Checks whether the given annotation is a valid document label/annotation.
```

This means that it is a non-empty string.

# **Parameters**

• ann - annotation

• error\_callback (function, optional) - optional callback that is called with any error messages, defaults to None

**Returns** whether the given annotation is a valid document label/annotation

## Return type bool

```
pine.client.models.is valid ner annotation (ann:
                                                                 typing.Any, error callback:
                                                         ing.Callable[[str], None] = None) \rightarrow bool
```

Checks whether the given annotation is a valid document NER annotation.

Valid NER annotations take one of two forms: a dict or a list/tuple of size 3.

A valid NER dict has the following fields:

- start: an int that is >= 0
- end: an int that is >= 0
- label: a non-empty str

A valid NER list/tuple has the following elements:

- element 0: an int that is  $\geq 0$
- element 1: an int that is  $\geq 0$
- element 2: a non-empty str

## **Parameters**

- ann annotation
- error\_callback (function, optional) optional callback that is called with any error messages, defaults to None

Returns whether the given annotation is a valid document label/annotation

Return type bool

```
pine.client.models.is_valid_annotation(body: dict, error_callback: typing.Callable[[str],
                                                   None = None \rightarrow bool
```

Checks whether the given body is valid to create an annotation.

A valid body is a dict with two fields:

- doc: a list of valid doc annotations (see is\_valid\_doc\_annotation())
- ner: a list of valid NER annotations (see is\_valid\_ner\_annotation())

#### **Parameters**

- **body** (dict) annotation body
- error\_callback (function, optional) optional callback that is called with any error messages, defaults to None

**Returns** whether the given body is valid to create an annotation

Return type bool

```
pine.client.models.is_valid_doc_annotations (doc_annotations: dict, error_callback: typ-
                                                            ing.Callable[[str], None] = None) \rightarrow bool
     Checks whether the given document annotations are valid.
```

A valid document annotations object is a dict, where the keys are str document IDs, and the values are valid annotation bodies (see <code>is\_valid\_annotation()</code>).

#### **Parameters**

- doc annotations document annotations
- error\_callback (function, optional) optional callback that is called with any error messages, defaults to None

**Returns** whether the given body is valid to create an annotation

## Return type bool

Bases: object

A class that can build the form and files fields that are necessary to create a collection.

#### Constructor.

## **Parameters**

- collection (dict, optional) starting parameters for the collection, defaults to None (not set)
- creator\_id (str, optional) user ID for the creator, see creator\_id(), defaults to None (not set)
- **viewers** (list(str), optional) viewer IDs for the collection, see viewer(), defaults to None (not set)
- annotators (list(str), optional) annotator IDs for the collection, see annotator(), defaults to None (not set)
- labels (list(str), optional) labels for the collection, see label(), defaults to None (not set)
- title (str, optional) metadata title, see title(), defaults to None (not set)
- **description** (str, optional) metadata description, see description(), defaults to None (not set)
- allow\_overlapping\_ner\_annotations (bool) optional configuration for allowing overlapping NER annotations, see allow\_overlapping\_ner\_annotations(), defaults to None (not set)
- **pipelineId** (*str*, *optional*) the ID of the pipeline from which to create the classifier, see *classifier()*, defaults to None (not set)
- overlap (float, optional) the classifier overlap, see classifier(), defaults to None (not set)

- train\_every (int, optional) train the model after this many documents are annotated, see classifier(), defaults to None (not set)
- classifierParameters (dict, optional) any parameters to pass to the classifier, see classifier(), defaults to None (not set)
- document\_csv\_file (str, optional) the filename of the local document CSV file, see document\_csv\_File(), defaults to None (not set)
- document\_csv\_file\_has\_header (bool, optional) whether the document CSV file has a header, see document\_csv\_File(), defaults to None (not set)
- document\_csv\_file\_text\_column (int, optional) if the document CSV file has headers, the document text can be found in this column index (the others are used for document metadata), see document\_csv\_File(), defaults to None (not set)
- image\_files (list(str)) any image files to add to the collection, see image\_file(), defaults to None (not set)

#### form

The form data.

Type dict

#### files

The files data.

Type dict

## property collection(self)

Returns the collection information from the form.

**Returns** collection information from the form

Return type dict

## property form\_json(self)

Returns the form where the values have been JSON-encoded.

Returns the form where the values have been JSON-encoded

Return type dict

# creator\_id (self, user\_id: str)

Sets the creator\_id to the given, and adds to viewers and annotators.

**Parameters** user\_id (str) - the user ID to use for the creator\_id

Returns self

**Return type** models.CollectionBuilder

## viewer (self, user\_id: str)

Adds the given user to the list of viewers.

Parameters user\_id(str) - the user ID to add as a viewer

Returns self

**Return type** models.CollectionBuilder

## annotator (self, user\_id: str)

Adds the given user to the list of annotators.

**Parameters**  $user_id(str)$  – the user ID to add as an annotator

Returns self

```
Return type models.CollectionBuilder
label (self, label: str)
     Adds the given label to the collection.
         Parameters label (str) – label to add
         Returns self
         Return type models.CollectionBuilder
metadata (self, key: str, value: typing.Any)
     Adds the given metadata key/value to the collection.
         Parameters
             • key (str) – metadata key
             • value - metadata value
         Returns self
         Return type models.CollectionBuilder
title (self, title: str)
     Sets the metadata title to the given.
         Parameters title (str) – collection title
         Returns self
         Return type models.CollectionBuilder
description (self, description: str)
     Sets the metadata description to the given.
         Parameters description (str) – collection description
         Returns self
         Return type models.CollectionBuilder
configuration (self, key: str, value: typing.Any)
     Adds the given configuration key/value to the collection.
         Parameters
             • key (str) – configuration key
             • value – configuration value
         Returns self
         Return type models.CollectionBuilder
allow_overlapping_ner_annotations (self, allow_overlapping_ner_annotations: bool)
     Sets the configuration value for allow_overlapping_ner_annotations to the given.
         Parameters allow_overlapping_ner_annotations (bool) – whether to allow over-
             lapping NER annotations
         Returns self
         Return type models.CollectionBuilder
classifier (self, pipelineId: str, overlap: float = 0, train_every: int = 100, classifierParameters: dict
               = \{ \} 
     Sets classifier information for the created collection.
```

## **Parameters**

- **pipelineId** (str) the ID of the pipeline from which to create the classifier
- overlap (float, optional) the classifier overlap, defaults to 0
- train\_every (int, optional) train the model after this many documents are annotated, defaults to 100
- classifierParameters (dict, optional) any parameters to pass to the classifier, defaults to {}

Returns self

Return type models.CollectionBuilder

document\_csv\_file (self, csv\_filename: str, has\_header: bool, text\_column: int)
Sets the CSV file used to create documents to the given.

May raise an Exception if there is a problem opening the indicated file.

#### **Parameters**

- csv\_filename (str) the filename of the local CSV file
- has\_header (bool) whether the CSV file has a header
- **text\_column** (*int*) if the CSV file has headers, the document text can be found in this column index (the others are used for document metadata)

Returns self

Return type models.CollectionBuilder

image\_file (self, image\_filename: str)

Adds the given image file to the collection.

May raise an Exception if there is a problem opening the indicated file.

**Parameters**  $image_filename(str)$  – the filename of the local image file

Returns self

Return type models.CollectionBuilder

is\_valid (self, error\_callback: typing.Callable[[str], None] = None)

Checks whether the currently set values are valid or not.

See  $is\_valid\_collection()$ .

**Parameters error\_callback** (function, optional) – optional callback that is called with any error messages, defaults to None

**Returns** whether the currently set values are valid or not

Return type bool

```
pine.client.models.remove_eve_fields(obj: dict, remove_timestamps: bool = True, remove_versions: bool = True)

Removes fields inserted by eve from the given object.
```

## **Parameters**

- **obj** (dict) the object
- remove\_timestamps (bool) whether to remove the timestamp fields, defaults to True
- remove\_versions (bool) whether to remove the version fields, defaults to True

```
pine.client.models.remove_nonupdatable_fields(obj: dict)
```

Removes all non-updatable fields from the given object.

These fields would cause a PUT/PATCH to be rejected because they are not user-modifiable.

Parameters obj (dict) - the object

pine.client.password

## **Module Contents**

## **Functions**

-	hash_password(password: str)	Hashes the given password for use in user object.
	<pre>check_password(password: str, hashed_password: str)</pre>	Checks the given password against the given hash.

 $\verb"pine.client.password.hash_password" (\textit{password: str}) \rightarrow \textit{str}$ 

Hashes the given password for use in user object.

Parameters password (str) - password

Returns hashed password

Return type str

pine.client.password.check\_password (password: str, hashed\_password: str)  $\rightarrow$  str Checks the given password against the given hash.

## Parameters

- password (str) password to check
- hashed\_password (str) hashed password to check against

**Returns** whether the password matches the hash

Return type bool

## **Package Contents**

## **Classes**

PineClient(backend_base_uri: str)	A client to access PINE (more specifically: the backend).		
LocalPineClient(backend_base_uri: str,	A client for a local PINE instance, including an		
eve_base_uri: str, mongo_base_uri: str = None,	:py:class<.EveClient>.		
mongo_dbname: str = EveClient.DEFAULT_DBNAME)			

continues on next page

## Table 43 – continued from previous page

```
CollectionBuilder(collection: dict = None, creator_id: str = None, viewers: typing.List[str] = None, annotators: typing.List[str] = None, labels: typing.List[str] = None, title: str = None, description: str = None, allow_overlapping_ner_annotations: bool = None, pipelineId: str = None, overlap: float = None, train_every: int = None, classifierParameters: dict = None, document_csv_file: str = None, document_csv_file_has_header: bool = None, document_csv_file_text_column: int = None, image_files: typing.List[str] = None)
```

## **Functions**

setup\_logging()

Sets up logging, if configured to do so.

```
class pine.client.PineClient(backend_base_uri: str)
     Bases: pine.client.client.BaseClient
     A client to access PINE (more specifically: the backend).
     Constructor.
          Parameters backend_base_uri (str) - the base URI for the backend server, e.g. "http://
              localhost:5000"
     is_valid(self)
          Returns whether this client and its connection(s) are valid.
              Returns whether this client and its connection(s) are valid
              Return type bool
     ping (self)
          Pings the backend server and returns the result.
              Raises exceptions.PineClientHttpException - if the HTTP request returns an er-
                  ror
              Returns the JSON response from the server (probably "pong")
     about (self)
          Returns the 'about' dict from the server.
              Raises exceptions. PineClientHttpException - if the HTTP request returns an er-
              Returns the JSON response from the server
              Return type dict
     get_logged_in_user(self)
          Returns the currently logged in user, or None if not logged in.
              Raises exceptions.PineClientHttpException - if the HTTP request returns an er-
```

Returns currently logged in user, or None if not logged in

# Return type dict

## get\_my\_user\_id(self)

Returns the ID of the logged in user, or None if not logged in.

Raises exceptions.PineClientHttpException – if the HTTP request returns an error

**Returns** the ID of the logged in user, or None if not logged in

Return type str

## is\_logged\_in(self)

Returns whether the user is currently logged in or not.

Raises exceptions.PineClientHttpException – if the HTTP request returns an error

Returns whether the user is currently logged in or not

Return type bool

## \_check\_login(self)

Checks whether user is logged in and raises an exceptions. PineClientAuthException if not.

#### Raises

- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

## get\_auth\_module(self)

Returns the PINE authentication module, e.g. "eve".

Raises exceptions.PineClientHttpException — if the HTTP request returns an error

Returns the PINE authentication module, e.g. "eve"

Return type str

## login\_eve (self, username: str, password: str)

Logs in using eve credentials, and returns whether it was successful.

## **Parameters**

- username (str) username
- password (str) password

## Raises

- exceptions.PineClientAuthException if auth module is not eve or login was not successful
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns whether the login was successful

Return type bool

# logout (self)

Logs out the current user.

 $\textbf{Raises} \ \textbf{exceptions}. \textbf{PineClientHttpException} - if the \ HTTP \ request \ returns \ an \ error$ 

## get\_pipelines (self)

Returns all pipelines accessible to logged in user.

#### Raises

- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns all pipelines accessible to logged in user

Return type list(dict)

## collection\_builder (self, \*\*kwargs: dict)

Makes and returns a new models. CollectionBuilder with the logged in user.

**Parameters** \*\*kwargs (dict) – any additional args to pass in to the constructor

Returns a new models. CollectionBuilder with the logged in user

Return type models.CollectionBuilder

create collection(self, builder: models.CollectionBuilder)

Creates a collection using the current value of the given builder and returns its ID.

Parameters builder (models.CollectionBuilder) - collection builder

## Raises

- exceptions.PineClientValueException if the given collection is not valid, see models.is\_valid\_collection()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns the created collection's ID

Return type str

get\_collection\_documents (self, collection\_id: str, truncate: bool, truncate\_length: int = 30)
Returns the documents in the given collection.

# **Parameters**

- collection\_id (str) the ID of the collection
- **truncate**  $(b \circ ol)$  whether to truncate the document text (a good idea unless you need it)
- truncate\_length (int, optional) how many characters of the text you want if truncated, defaults to 30

**Returns** the documents in the given collection

Return type list(dict)

Will use the logged in user ID for the creator\_id if none is given. Although all the parameters are optional, you must provide values either in the document or through the kwargs in order to make a valid document.

## **Parameters**

• document (dict, optional) – optional document dict, will be overridden with any kwargs, defaults to {}

- creator\_id (str, optional) optional creator\_id for the document, defaults to None (not set)
- **collection\_id** (*str*, *optional*) optional collection\_id for the document, defaults to None (not set)
- overlap (int, optional) optional overlap for the document, defaults to None (not set)
- text (str, optional) optional text for the document, defaults to None (not set)
- metadata (dict, optional) optional metadata for the document, defaults to None (not set)

- exceptions.PineClientValueException if the given document parameters are not valid, see models.is\_valid\_eve\_document()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns the created document's ID

## Return type str

add\_documents (self, documents: typing.List[dict], creator\_id: str = None, collection\_id: str = None)
Adds multiple documents at once and returns their IDs.

Will use the logged in user ID for the creator\_id if none is given.

#### **Parameters**

- documents (list (dict)) the documents to add
- **creator\_id** (*str*, *optional*) optional creator\_id to set in the documents, defaults to None (not set)
- **collection\_id** (str, optional) optional collection\_id to set in the documents, defaults to None (not set)

## **Raises**

- exceptions.PineClientValueException if any of the given documents are not valid, see models.is\_valid\_eve\_document()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns the created documents' IDs

**Return type** list(str)

## **Parameters**

- **document\_id** (str) the document ID to annotate
- doc\_annotations (list(str)) document annotations/labels
- **ner\_annotations** (*list*) NER annotations, where each annotation is either a list or a dict

- exceptions.PineClientValueException if any of the given annotations are not valid, see models.is\_valid\_annotation()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

**Returns** the annotation ID

Return type str

Annotates documents in a collection.

## **Parameters**

- collection\_id (str) the ID of the collection containing the documents to annotate
- document\_annotations (dict) a dict containing "ner" list and "doc" list
- **skip\_document\_updates** (bool) whether to skip updating the document "has\_annotated" map, defaults to False. This should only be True if you properly set the "has\_annotated" map when you created the document.

#### Raises

- exceptions.PineClientValueException if any of the given annotations are not valid, see models.is\_valid\_doc\_annotations()
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

Returns the annotation IDs

**Return type** list(str)

list\_collections (self, include\_archived: bool = False)

Returns a list of user's collections.

**Parameters include\_archived** (bool) – whether to include archived collections, defaults to False

## Raises

- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error

**Returns** user's collections

**Return type** list(dict)

Downloads collection data.

## **Parameters**

- collection\_id (str) the ID of the collection for which to download data
- include\_collection\_metadata (bool) whether to include collection metadata, defaults to True

- include\_document\_metadata (bool) whether to include document metadata, defaults to True
- include\_document\_text (bool) whether to include document text, defaults to True
- include annotations (bool) whether to include annotations, defaults to True
- include\_annotation\_latest\_version\_only (bool) whether to include only the latest version of annotations (True) or all versions (False), defaults to True

- exceptions.PineClientValueException if given empty collection ID
- exceptions.PineClientAuthException if not logged in
- exceptions.PineClientHttpException if the HTTP request returns an error, such as if the collection doesn't exist

Returns collection data

Return type dict

Bases: pine.client.client.PineClient

A client for a local PINE instance, including an :py:class<.EveClient>.

Constructor.

## **Parameters**

- backend\_base\_uri (str) the base URI for the backend server, e.g. "http://localhost:5000"
- eve\_base\_uri (str) the base URI for the eve server, e.g. "http://localhost:5001"
- mongo\_base\_uri (str, optional) the base URI for the mongodb server, e.g. "mongodb://localhost:27018", defaults to None
- mongo\_dbname (str, optional) the DB name that PINE uses, defaults to "pmap\_nlp"

#### eve : EveClient

The local EveClient instance.

Type EveClient

## is\_valid(self)

Returns whether this client and its connection(s) are valid.

**Returns** whether this client and its connection(s) are valid

Return type bool

```
pine.client.setup_logging()
```

Sets up logging, if configured to do so.

The environment variable named by  $CONFIG\_FILE\_ENV$  is checked and, if present, is passed to logging.config.dictConfig().

Bases: object

A class that can build the form and files fields that are necessary to create a collection.

#### Constructor.

#### **Parameters**

- collection (dict, optional) starting parameters for the collection, defaults to None (not set)
- **creator\_id** (str, optional) user ID for the creator, see creator\_id(), defaults to None (not set)
- viewers (list(str), optional) viewer IDs for the collection, see viewer(), defaults to None (not set)
- annotators (list(str), optional) annotator IDs for the collection, see annotator(), defaults to None (not set)
- labels (list(str), optional) labels for the collection, see label(), defaults to None (not set)
- title (str, optional) metadata title, see title (), defaults to None (not set)
- **description** (*str*, *optional*) metadata description, see *description* (), defaults to None (not set)
- allow\_overlapping\_ner\_annotations (bool) optional configuration for allowing overlapping NER annotations, see allow\_overlapping\_ner\_annotations(), defaults to None (not set)
- **pipelineId** (*str*, *optional*) the ID of the pipeline from which to create the classifier, see *classifier()*, defaults to None (not set)
- overlap (float, optional) the classifier overlap, see classifier(), defaults to None (not set)
- **train\_every** (*int*, *optional*) train the model after this many documents are annotated, see *classifier()*, defaults to None (not set)
- classifierParameters (dict, optional) any parameters to pass to the classifier, see classifier(), defaults to None (not set)
- document\_csv\_file (str, optional) the filename of the local document CSV file, see document csv File(), defaults to None (not set)
- document\_csv\_file\_has\_header (bool, optional) whether the document CSV file has a header, see document\_csv\_File(), defaults to None (not set)

```
    document_csv_file_text_column (int, optional) - if the document CSV file has headers, the document text can be found in this column index (the others are used for document metadata), see document_csv_File(), defaults to None (not set)
    image_files (list(str)) - any image files to add to the collection, see image_file(), defaults to None (not set)
```

#### form

The form data.

Type dict

## files

The files data.

Type dict

## property collection(self)

Returns the collection information from the form.

**Returns** collection information from the form

Return type dict

# property form\_json(self)

Returns the form where the values have been JSON-encoded.

Returns the form where the values have been JSON-encoded

Return type dict

## creator\_id (self, user\_id: str)

Sets the creator\_id to the given, and adds to viewers and annotators.

**Parameters user\_id** (str) – the user ID to use for the creator\_id

Returns self

Return type models.CollectionBuilder

viewer (self, user\_id: str)

Adds the given user to the list of viewers.

**Parameters user\_id** (str) – the user ID to add as a viewer

Returns self

Return type models.CollectionBuilder

annotator (self, user\_id: str)

Adds the given user to the list of annotators.

**Parameters user\_id** (str) – the user ID to add as an annotator

Returns self

Return type models.CollectionBuilder

label (self, label: str)

Adds the given label to the collection.

Parameters label (str) - label to add

Returns self

Return type models.CollectionBuilder

```
metadata (self, key: str, value: typing.Any)
     Adds the given metadata key/value to the collection.
         Parameters
             • key (str) – metadata key
             • value – metadata value
         Returns self
         Return type models.CollectionBuilder
title (self, title: str)
     Sets the metadata title to the given.
         Parameters title (str) – collection title
         Returns self
         Return type models.CollectionBuilder
description (self, description: str)
     Sets the metadata description to the given.
         Parameters description (str) – collection description
         Returns self
         Return type models.CollectionBuilder
configuration (self, key: str, value: typing.Any)
     Adds the given configuration key/value to the collection.
         Parameters
             • key (str) – configuration key
             • value – configuration value
         Returns self
         Return type models.CollectionBuilder
allow_overlapping_ner_annotations (self, allow_overlapping_ner_annotations: bool)
     Sets the configuration value for allow_overlapping_ner_annotations to the given.
         Parameters allow_overlapping_ner_annotations (bool) – whether to allow over-
             lapping NER annotations
         Returns self
         Return type models.CollectionBuilder
classifier (self, pipelineId: str, overlap: float = 0, train_every: int = 100, classifierParameters: dict
               = \{\}
     Sets classifier information for the created collection.
         Parameters
             • pipelineId (str) – the ID of the pipeline from which to create the classifier
             • overlap (float, optional) - the classifier overlap, defaults to 0
             • train_every (int, optional) - train the model after this many documents are
               annotated, defaults to 100
             • classifierParameters (dict, optional) - any parameters to pass to the clas-
```

sifier, defaults to {}

```
Returns self
```

**Return type** models.CollectionBuilder

 ${\tt document\_csv\_file} \ (\textit{self, csv\_filename: str, has\_header: bool, text\_column: int})$ 

Sets the CSV file used to create documents to the given.

May raise an Exception if there is a problem opening the indicated file.

#### **Parameters**

- $csv_filename(str)$  the filename of the local CSV file
- has\_header (bool) whether the CSV file has a header
- **text\_column** (*int*) if the CSV file has headers, the document text can be found in this column index (the others are used for document metadata)

Returns self

Return type models.CollectionBuilder

image\_file (self, image\_filename: str)

Adds the given image file to the collection.

May raise an Exception if there is a problem opening the indicated file.

**Parameters** image\_filename (str) - the filename of the local image file

Returns self

Return type models.CollectionBuilder

is\_valid (self, error\_callback: typing.Callable[[str], None] = None)

Checks whether the currently set values are valid or not.

See is\_valid\_collection().

Parameters error\_callback (function, optional) - optional callback that is called with any error messages, defaults to None

**Returns** whether the currently set values are valid or not

Return type bool
